

Proposed Inheritance Hierarchy.

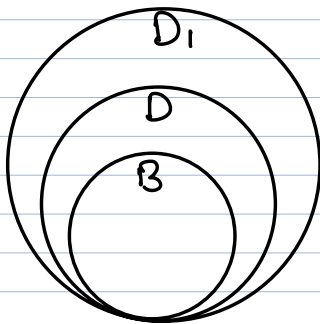

B : Base class

D : Directly derives itself from B.

D₁ : Directly Derives itself from D
and indirectly derives itself from B.

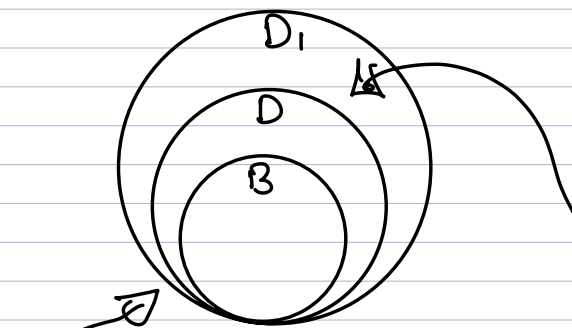

Irrespective of how D derives itself from B, all member functions of D can access protected + public members of those objects of B which are embedded in derived objects. But what part of objects of B embedded within D embedded within D₁ are visible to member functions of D₁ is affected by how D derives from B.

Memory layout of object of class D₁.

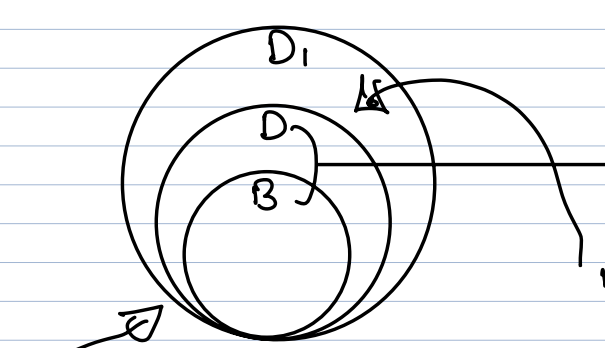

Base Member	Public Inheritance	Protected Inheritance	Private Inheritance
public	public	protected	private
protected	protected	protected	private
private	inaccessible	inaccessible	inaccessible

external function
D1 myObjD1;
 B → public available

member function of indirectly derived class D1
this, D1 myObjD1;
 B → protected
 → public

public inheritance.

external function
D1 myObjD1;
 B — invisible

member function of indirectly derived class D1
this, D1 myObjD1;
 B → protected
 → public

protected inheritance.
